

The storage cache reported an error reading the native disk

Symptom

Upon starting a replication the task fails off with the following:

```
The storage cache reported an error reading the native disk at '*****'  
Could not read native disk '/generic-path'  
Warn Server Error in native function (ngetVolume) returned (1)
```

Cause

This warning message is usually caused by a Volume being created and then the physical files/directories being removed manually.

Resolution

The internal CDP Server database still has that volume recorded and currently only restarting the service will reread the volumes/disks.

To restart service:
