Protecting SQL Server

CDP Enterprise and Advanced Editions allow you to protect SQL Server installed on the Agent machine. This function allows you to take a snapshot. Since CDP uses the VSS Exchange writer, it ensures data integrity and consistency during the backup operation.

A list of supported editions can be found in System Requirements - CDP for Databases.

To protect MS Exchange, enable the Databases Add-on on the Agent. See Enabling Databases Add-On for Agent.

The following CDP interface elements help you protect your SQL Server:

- The "SQL" tab in the Policy window
- The "SQL" tab in the "Task History"
- The "SQL" action in the "Recovery Points" list

Here is a collection of pages devoted to protecting MS SQL databases.

- Enabling Databases Add-On for Agent
- Configuring MS SQL Server Replication
- Restoring MS SQL Server
- Restoring a MS SQL Server to an Alternate Location
